# MEZ PAHLAN

Mez Pahlan is a Senior Consultant within IBM Global Business Services who is experienced in Mobile technologies, Agile, DevOps, Continuous Integration, Open Source, Front End Development, and Visual Design. He has a proven track record in building and participating in technical teams and working early on in a project's lifecycle. Mez has experience of Mobile development for Android and Hybrid using various Javascript frameworks.

Mez is highly motivated and has self taught himself various programming languages. He is a keen user / contributor to open source projects (active on Github). Mez is passionate about pair programming, has participated in Agile development (Scrum), and and has a keen focus on continuous improvement. Mez understands the need to test early and test often. He has used browser testing VMs and continuous integration to accomplish achieve this continuous feedback.

Mez has worked on both small and large development teams. 6 (Scrum based) - 15 (waterfall based). Mez has also worked closely with Product Owners during sprint planning, sprints, and retrospectives.

## EDUCATION

| | |
|---|---|
| Degree | Master of Science in Physics (Hons) |
| University | Imperial College London |
| Thesis | Design Requirements For An Imperial College Pico Sat, 2007 |

## LANGUAGES

| | |
|---|---|
| English | Native |
| Español | Un poco |

## KEY SKILLS

| | |
|---|---|
| Development | JavaScript (Angular, Jquery), JSON, XML, HTML, CSS, Android, Java (Spring) |
| Task Runners | Yeoman, Grunt |
| Servers | Apache, node.js, Tomcat |
| Unit Testing | SOAPUI, Karma, Jasmine, JUnit, Mockito, Modern.ie |
| Source Control | Git, SVN, ClearCase |
| CI | Jenkins / Hudson, RTC, Continuum |
| Scripting | ANT, Python, Perl, Shell / Command |
| Testing | Systems Test, System Integration Test, Test Support |
| Architecture | Component Design, Micro Designs, Interface Designs |

## CAREER HISTORY

IBM
04/2008 - present

I.T. Consultant

As a member of IBM Global Business Services I have worked on various enterprise projects performing a variety of roles.

## ASSIGNMENTS

Monitise
10/2014 - present

DevOps Lead (temporary)

Filling in for the DevOps Lead whilst the role is resourced: I have helped shape the environment, configuration, and release processes for a new project that Monitise and IBM are partnering to deliver. This role involves understanding requirements from various workstreams and coordinating with the Test Lead to ensure that environments and code are ready according to the defined plan.

Lloyds Banking Group
03/2014 - 09/2014

Integration Developer

As a POC IBM at LBG wants to build an analytics database to make use of the vast amount of sensory information that LBG Digital group creates. This consists of the database itself, integration to sources within the bank, and a dashboard.

I collated all the integration touch points for the POC and extracted information using a variety of scripted and programming techniques. The data was collected and transformed into a CSV format. This allowed easy loading to the database where the real number crunching could take place. Key skills used on this project were quickly understanding the bank's systems, scripting using a number of languages (Python, Perl), and exposing the data to the database.

RBS
10/2013 - 02/2014

Single Page Application Developer

C-View & SureSale are two projects in the RBS Future Bank initiative to modernise the way the bank interacts with customers. C-View delivers a tablet application to branch staff as well as an internal website for staff. This puts a single view of the customer in one place. SureSale delivers a website and aims to reduce the risk associated with miss selling of financial products by recording a customer journey. Both projects utilise a modern web stack to deliver a richer experience to their user base (HTML5, CSS3, JavaScript). Both projects were conducted using Agile (Scrum) techniques.

I performed mixed duties associated with both a Team Lead and a Developer such as providing estimates and planning as well as technical delivery as part of a team. I was heavily involved with the development and testing in the Scrum team. Mez defined coding patterns and principles by which the Scrum team should work.

# ASSIGNMENTS

RBS
03/2013 - 09/2013

Resilience Reviewer

Following a number of public outages to the RBS estate IBM were asked to conduct a resilience review of the core banking applications in use by the bank. The review team conducted workshops with SMEs from the bank creating observations, findings, and recommendations. These were presented as a series of reports back to the main stakeholders from the bank. A recognised IBM method for Resilience Reviews was utilised that allowed workshops, presentations, and reports to be conducted in such a way that priorities could be extracted for the bank which would lead on to remediation work. In addition, following on from a recommendation from the Resilience Review, a proposal for a Knowledge Management suite to offer the bank was created and presented throughout the period of this assignment.

I was part of the review team that assessed the overall resilience of 6 core banking applications. This involved asking probing questions to the SMEs during the workshops, collecting notes and actions from the meetings, following up with additional questions via email, presenting weekly status updates to the key stakeholder for the project, and writing a portion of the final report.

I also helped draft a presentation for a Knowledge Management offering to the bank. This followed up on a recommendation from the Resilience Review to better capture and manage information that the bank held.

MOD
11/2012 - 02/2013

Junior Architect

The project involved a transition of the current hardware and software stack to a new strategic hardware and software stack. The main aims of the project were to provide like for like capability from the previous system as a minimum but also tack the opportunity to unify certain aspects of the front end that had become disjointed over the years.

I helped the lead Architect for the refresh project. This involved investigating various options for the transition solution. These involved areas such as security of web services, user single sign on, high availability and compatible versions of upgraded components of the software stack. I also helped define the software requirements for part of the middleware. This involved a white paper for options on how a software component should be upgraded with respect to the associated costs.

I explored options for hardware virtualisation that involved slightly tweaking the baseline hardware stack that was presented by the client in order to better support a future upgrade project. By adopting the latest virtualisation technology the project would be better supported by the hardware vendor for a longer period of time. This would also mitigate against an inevitable transition project in the future.

# ASSIGNMENTS

HomeOffice
04/2012 - 11/2012

Junior Architect

IBM are working with the client to provide a more efficient solution to their Visa application systems using the CRM tool Siebel. The main aims of the assignment are to change the business and its processes to improve efficiency, quality and customer service; and to deliver a fit for purpose enabling IT infrastructure. It will also allow the client to create a simplified set of immigration processes that are efficient, fully defined and standardised across the business enabling fundamental changes and solutions from and end to end perspective.

The Integration team is tasked with the link between existing IT systems and the new solution delivered by IBM incorporating a SOA solution. I designed Service Oriented Architectures to fulfil a wide range of client business functionality. I developed continuous integration test frameworks for the Integration development team and successfully rolled out this method to the other development teams on the project. I have worked with development, client and architect teams to define an end state architecture for the programme. I created a Common Exception Handling framework for the programme to better capture and categorise errors that occur throughout the system.

HomeOffice
04/2011 - 04/2012

Integration Team Lead

I lead a team of 13 developers successfully through three independent phases of delivery. I have analysed functional requirements and translated them into work products that developers on his team must complete to satisfy these requirements. I have estimated development effort based on IBM methods for multiple phases of the project for the Integration Team. I have completed impact analysis for change requests from the client.

I have set up new best practices and patterns to follow to strengthen and future proof the Integration code. I have empowered my team to contribute assets from development to other IBM projects.

HomeOffice
09/2009 - 04/2011

Integration Developer

I analysed existing external system interfaces that enabled me to design, document, build and unit test integration functionality in Oracle Service Bus. I took ownership of his assigned interface solution as well as contributing to numerous other interfaces in the team.

I pro-actively sought to improve processes and gain efficiencies within the team by creating an automated test harness for the team's services. This has allowed the team to incorporate a continuous build/deploy/test cycle which allows the team to have up to the minute tested code deployed on the development servers ready for movement into other environments such as test and preproduction.

I also worked closely with the Siebel and BA teams to create a pick list of frequently used cross referenced values. This is then loaded into a database from a spreadsheet incorporating a VBA script so that the these values need only be changed in one place. I also contributed to creating a Wiki for the development team to document non deliverable processes such as build information.

# ASSIGNMENTS

M&S
06/2008 - 09/2009

Test Analyst

As part of a 10 year regeneration of the IT infrastructure, IBM are in charge of testing and project managing the upgrades to the point of sale tills/ software / network. In the SR5 stage, the till software is being upgraded to a new iPOS (Point Of Sale) solution built by an external vendor. A software development team from IBM has been tasked with building a monitoring application for the till estate for which our test team will be performing the system and integration test phases. Additionally the Operability team have gone through various rounds of test assurance both with IBM and client architects. This ensures that the level of testing is suitable and the client can be assured value. It also forms part of the final deliverable to the project.

I took part in testing of the till monitoring software which has involved writing, assuring and executing the scripts. Mr Pahlan has presented the software to the client in walk through presentations and one to one demonstrations and is the subject matter expert for the software on the client site.

I also contributed to several documents for sign off. These include assurance documents and the DTP (Detailed Test Plan). They have been reviewed by architects and the Senior Design Authority on the project before being signed off by the client.

I contributed to a data dictionary for both the wider project use and a more specific one for the Operability team that explains frequently used terms and a set of bookmarks to assist testing.
